

What is DevOps?

DevOps is a blend of Development (Dev) and Operations (Ops). It is a cultural shift and a set of practices aimed at bringing software developers and IT operations teams together.

In traditional environments, developers would write code and then "hand it over" to operations to deploy and maintain, which often led to friction and delays. DevOps breaks down these, so teams can build, test, and release software faster and more reliably.

Advantages of DevOps

- **Faster Time to Market:** Features and fixes get to the users much quicker.
- **Better Collaboration:** Teams work together instead of blaming each other when something breaks.
- **High Quality & Reliability:** Automated testing ensures that bugs are caught early before they hit production.

What is Agile Methodology & Scrum?

Agile is a modern project management approach that focuses on breaking a large project down into smaller, manageable chunks. Instead of trying to build everything at once and delivering it at the very end (the old "Waterfall" way),

Agile focuses on continuous improvement, flexibility, and delivering working software frequently.

Scrum is simply a specific, highly popular framework *inside* the Agile philosophy. It provides a structured set of rules, roles (like Scrum Master and Product Owner), and meetings to help teams actually execute Agile principles. Work in Scrum is divided into fixed time blocks called Sprints (usually 2 to 4 weeks long).

What are the Important Meetings in Agile?

1. **Sprint Planning:** Held at beginning of a Sprint. The team decides what work from backlog they can realistically finish during upcoming Sprint.

2. **Daily Standup (Daily Scrum):** A quick, 15-minute daily meeting where team members answer three questions: What did I do yesterday? What will I do today? Are there any blockers in my way?
3. **Sprint Review:** Held at the end of the Sprint. The team shows off the working software they built to stakeholders and gets feedback.
4. **Sprint Retrospective:** Held at the very end of the Sprint. The team looks backward to discuss what went well, what went wrong, and how they can improve their processes in the next Sprint.

What are the advantages of Agile?

- **Flexibility:** It is easy to change direction if user needs or market demands shift.
- **Customer Satisfaction:** Because customers see progress regularly, they get exactly what they want.
- **Reduced Risk:** Testing happens constantly, so major failures are caught early rather than at the very end of a year-long project.
- **Transparency:** Everyone on the team (and the stakeholders) knows exactly what is happening at any given time.
